RESEARCH STUDY

PART II Brain Study

This part of the study aims to reveal specific brain targets that relate to adolescent eating behaviors. We hope this may modify existing prevention and treatment to make them more effective for this population of at-risk adolescents.

During the 2-hour lab visit participant will complete several questionnaires querying eating behavior and personality characteristics, and do a few computer tasks (puzzle and game-like exercises) while wearing “sensor net” that records their brain activity.

All the information we collect is confidential.

If you or your child is between 13-19 years old and interested in participate in the study, please contact our project manager, Lucy Chen (chensiqi1223@tamu.edu or 715-523-0003) or go to our website (http://nld.tamu.edu/impulsivity-study-participation).
